

## Optimised surface at rigid axles 5,5t – 7t

### Sample figure:

### General:

As part of our product optimising process we have examined and improved the contact surfaces of the spindle and the compact bearing.

### Features of optimised surface:

Together with the adherent Molykote TP42 and the flatted areas of the bearing seats, we could significantly reduce the effect of fretting.

### Changeover:

This product improvement is running stepwise into the production from July 2018.
