

Optimisation of the automatic GIGANT slack adjuster

Progressive introduction as of the 1st quarter of 2024

General aspects

As part of the ongoing optimisation of GIGANT products, the automatic slack adjuster was further optimised.

What will change?

<p>Current setting mechanism:</p> 		<p>Current emergence points for grease during lubrication:</p> 
<p>In the future with cap:</p> 		<p>Future emergence point for grease during lubrication:</p> 
<p>The cap prevents the ingress of moisture even better.</p>		<p>The grease emerges at a defined point through a pressure relief opening.</p>

Note:

The technical properties of the automatic slack adjuster as well as the readjustment characteristics remain unchanged, so that the item maintains the same order number!

Mixed installation of both versions on one axle is therefore permitted!

Conclusion:

Thanks to the combination of the additional cap on the setting mechanism, it is even more optimally protected against the ingress of moisture, e.g. due to the capillary effect.

The automatic slack adjuster has lifetime lubrication upon delivery. With the new pressure relief opening, optimal grease distribution with fresh grease for all internal components is achieved when lubricating. As a result, the life cycle is significantly extended once more.

The GIGANT team is happy to answer any questions you may have and wishes you a safe journey.
